

230015LR90

230015LR20

● SPECIFICATIONS

The double jet ball head makes it very easy to switch between a straight jet (or pencil jet) and a flat jet (or brush jet).

The ball head is equipped with two high-pressure nozzles: one nozzle with a 0° angle (straight jet) and one nozzle with a 25° angle (flat jet).

The high pressure jet is released according to the angle of the lance, that is to say a slight rotation in one direction or the other, which causes a small ball to move inside the head and release one or other of the two nozzles.

This accessory is recommended for high flow rates.

The straight jet allows for effective cleaning of corners (livestock buildings) and hard to reach areas (agricultural equipment). Thanks to its high flow rate, the flat jet covers large areas (floors, walls, car bodies).

Determine the size of nozzle adapted to your HP washer.
